(54) Title: IMPROVED METHOD FOR BISULFITE TREATMENT

(57) Abstract: The present application is directed to a method for performing a bisulfite reaction to determine methylation positions in a nucleic acid, i.e. methylated and non-methylated cytosines, whereby the nucleic acid is incubated in a solution comprising the nucleic acid for a time period of 1.5 to 3.5 hours at a temperature between 70 and 90 °C, whereby the concentration of bisulfite in the solution is between 3 M and 6.25 M and whereby the pH value of the solution is between 5.0 and 6.0 whereby the nucleic acid, i.e. the cytosine bases in the nucleic acid, are deaminated. Then the solution comprising the deaminated nucleic acid is desulfonated and preferably desalted. The application is further related to a solution comprising bisulfite with a certain pH and uses thereof as well as a kit comprising the solution.

WO 2004/067545 A1

Improved method for bisulfite treatment

Field of the invention

The present application is directed to a method for performing a bisulfite reaction
5 to determine methylation positions in a nucleic acid, i.e. methylated and non-
methylated cytosines, whereby the nucleic acid is incubated in a solution
comprising the nucleic acid for a time period of 1.5 to 3.5 hours at a temperature
between 70 and 90 °C, whereby the concentration of bisulfite in the solution is
10 between 3 M and 6.25 M and whereby the pH value of the solution is between 5.0
and 6.0 whereby the nucleic acid, i.e. the cytosine bases in the nucleic acid, is
deaminated. Then the solution comprising the deaminated nucleic acid is
desulfonated and preferably desalted. The application is further related to kit with a
solution comprising bisulfite with a certain pH and uses thereof as well as a kit
comprising the solution.

15 Background of the invention

Genes constitute only a small proportion of the total mammalian genome, and the
precise control of their expression in the presence of an overwhelming background
of noncoding deoxyribonucleic acid (DNA) presents a substantial problem for their
regulation. Noncoding DNA, containing introns, repetitive elements, and
20 potentially active transposable elements requires effective mechanisms for its long
term silencing. Mammals appear to have taken advantage of the possibilities
afforded by cytosine methylation to provide a heritable mechanism for altering
DNA-protein interactions to assist in such silencing. DNA methylation is essential
for the development of mammals and plays a potential role during aging and
25 cancer. The involvement of methylation in the regulation of gene expression and as
an epigenetic modification marking imprinted genes is well established. In
mammals, methylation occurs only at cytosine residues and more specifically only
on cytosine residues adjacent to a guanosine residue, i.e. at the sequence CG. The
detection and mapping of DNA methylation sites are essential steps towards
30 understanding the molecular signals which indicate whether a given sequence is
methylated.

This is currently accomplished by the so-called bisulfite method described by Frommer, M., et al., Proc. Natl. Acad. Sci. USA 89 (1992) 1827-1831, for the detection of 5-methyl-cytosines. The bisulfite method of mapping 5-methylcytosine uses the effect that sodium hydrogen sulfite reacts with cytosine but not or only poorly with 5-methyl-cytosine. Cytosine reacts with bisulfite to form a sulfonated cytosine reaction intermediate being prone to deamination resulting in a sulfonated uracil which can be desulfonated to uracil under alkaline conditions (see Fig. 1). It is common knowledge that uracil has the base pairing behavior of thymine different to the educt cytosine whereas 5-methylcytosine has the base pairing behavior of cytosine. This makes the discrimination of methylated or non-methylated cytosines possible by e.g. bisulfite genomic sequencing (Grigg, G., and Clark, S., Bioessays 16 (1994) 431-436; Grigg, G.W., DNA Seq. 6 (1996) 189-198) or methylation specific PCR (MSP) disclosed in US 5,786,146. Basic studies on the reaction of uracil and cytosine derivatives with bisulfite have been performed by Shapiro et al., JACS 92 (1970) 422-424.

There are various documents addressing specific aspects of the bisulfite reaction.

Hayatsu, H., et al., Biochemistry 9 (1970) 2858-2865 reacted uracil, cytosine or their derivatives with 1 M bisulfite, at a pH value around 6, at 37°C for 24 hours. Hayatsu, H., et al., J. Am. Chem. Soc. 92 (1970) 724-726 describe the reaction of cytosine with 3 M bisulfite at a pH value around 6 at a temperature of 80 °C for 30 min. Slae and Shapiro, J. Org. Chem. 43 (1978) 4197-4200 describe the deamination of cytidine with 1 M bisulfite around neutral pH at various temperatures whereby the reaction time is not described. There were no investigations of the deamination of cytosine or methyl-cytosine in nucleic acids in these documents.

Paulin, R., et al., Nucl. Acids Res. 26 (1998) 5009-5010 investigate the effects of urea on the efficiency of bisulfite-mediated sequencing of 5-methylcytosine in DNA. The DNA is reacted with 3.44 M bisulfite in the presence of 5.36 M urea and 0.5 mM hydroquinone, at a pH value of 5.0 at a temperature of 55 °C for 15 hours.

Raizis, A.M., et al., Anal. Biochem. 226 (1995) 161-166 disclose a bisulfite method for 5-methylcytosine mapping that minimizes template degradation. They investigate a method minimizing template degradation using 5 M bisulfite solutions

- 3 -

in the presence of 100 mM hydroquinone at a pH value of 5 at 50°C. A maximum yield of PCR product was observed after 4 hours. Other conditions as increased pH and lower temperatures were also investigated.

- 5 Grunau, C., et al., Nucleic Acids Res 29 (2001) e65-5, page 1 to 7, perform a systematic investigation of critical experimental parameters of the bisulfite reaction. They investigate bisulfite solutions of 3.87 to 4.26 and 5.2 to 5.69 M at a pH value of 5. Temperatures that were tested are 15, 35, 55, 80, 85 and 95 °C for 1, 4 and 18 hours. DNA degradation is a problem in these investigations.
- 10 Wang, R.Y., et al., Nucleic Acids Res. 8 (1980) 4777-4790 disclose the use of a 3 M bisulfite solution at a pH value of 5.5 at a temperature of 37°C for various time periods in the bisulfite treatment of DNA. Feil, R., et al., Nucleic Acids Res 22 (1994) 695-696 disclose the use of a 3.5 M bisulfite solution at a pH value of 5 at a temperature of 0°C for 24 hours in the bisulfite treatment of DNA. Clark, S.J., et al., Nucleic Acids Res 22 (1994) 2990-2997, disclose the use of a 3 to 4 M bisulfite
15 solution at a pH value of 4.8 to 5.8 at a temperature of 37 to 72 °C for 8 to 16 hours in the bisulfite treatment of DNA. Tasheva, E.S., and Roufa, D.J., Mol. Cell. Biol. 14 (1994) 5636-5644 disclose the use of a 1 M bisulfite solution at a pH value of 5 at a temperature of 50 °C for 48 hours in the bisulfite treatment of fragments of genomic DNA. Grigg, G.W., DNA Seq 6 (1996) 189-198 discloses the use of a 3.1 M
20 bisulfite solution at a pH value of 5 at a temperature of 50 °C for 16 hours in the bisulfite treatment of DNA. Komiyama, M., and Oshima, S., Tetrahedron Letters 35 (1994) 8185-8188 disclose the use of a 1 M bisulfite solution at a pH value of 5 at a temperature of 37 °C for 4 hours in the bisulfite treatment of DNA whereby diethylenetriamine is present.
- 25 Olek, A., et al., Nucleic Acids Res. 24 (1996) 5064-5066 disclose a method for bisulfite base sequencing whereby bisulfite treatment and subsequent PCR steps are performed on material embedded in agarose beads. A 5 M bisulfite solution at a pH value of 5 at a temperature of 50 °C is used for 4 hours in the bisulfite treatment of DNA.
- 30 A review of DNA methylation analysis can be found in Oakeley, E. J., Pharmacol. Ther. 84 (1999) 389-400.

- 4 -

Different additional components in the bisulfite mixture are disclosed by WO 01/98528, WO02/31186 or by Paulin, R., et al., Nucleic Acids Res 26 (1998) 5009-5010.

5 Kits for performing bisulfite treatments are commercially available from Intergen, now distributed by Serologicals Corporation, Norcross, GA, USA, e.g. CpGenome™ DNA modification kit (http://www.serologicals.com/products/int_prod/index.html).

10 All prior art methods for the bisulfite treatment have disadvantages. Therefore, the problem to be solved by the present invention was to provide a method which overcomes the disadvantages of the prior art methods.

Summary of the invention

15 The present invention provides a method for the conversion of a cytosine base, preferably cytosine bases, in a nucleic acid to an uracil base, preferably cytosine bases, whereby preferably a 5-methyl-cytosine base, preferably 5-methyl-cytosine bases, is not significantly converted, comprising the steps of

- 20 a) incubating a solution comprising the nucleic acid for a time period of 1.5 to 3.5 hours at a temperature between 70 and 90 °C, whereby the concentration of bisulfite in the solution is between 3 M and 6.25 M and whereby the pH value of the solution is between 5.0 and 6.0 whereby the nucleic acid is deaminated, and
- b) incubating the solution comprising the deaminated nucleic acid under alkaline conditions whereby the deaminated nucleic acid is desulfonated.

25 Further, the invention provides a solution with a pH value between 5.0 and 6.0 and comprising bisulfite in a concentration between 3 M and 6.25 M, uses thereof and kits comprising this solution.

As known to the expert skilled in the art and according to the invention, the term "bisulfite" is used interchangeably for "hydrogensulfite".

- 5 -

According to the invention the term a "bisulfite reaction", "bisulfite treatment" or "bisulfite method" shall mean a reaction for the conversion of a cytosine base, preferably cytosine bases, in a nucleic acid to an uracil base, preferably uracil bases, in the presence of bisulfite ions whereby preferably a 5-methyl-cytosine base, preferably 5-methyl-cytosine bases, is not significantly converted. This reaction for the detection of methylated cytosines is described in detail by Frommer et al., supra and Grigg and Clark, supra. The bisulfite reaction contains a deamination step and a desulfonation step which can be conducted separately or simultaneously (see Figure 1; Grigg and Clark, supra). The statement that 5-methyl-cytosine bases are not significantly converted shall only take the fact into account that it cannot be excluded that a small percentage of 5-methyl-cytosine bases is converted to uracil although it is intended to convert only and exclusively the (non-methylated) cytosine bases (Frommer et al., supra). The expert skilled in the art knows how to perform the bisulfite reaction, e.g. by referring to Frommer et al., supra or Grigg and Clark, supra who disclose the principal parameters of the bisulfite reaction. From Grunau et al., supra, it is known to the expert in the field what variations of the bisulfite method are possible. In summary, in the deamination step a buffer containing bisulfite ions, optionally chaotropic agents and optionally further reagents as an alcohol or stabilizers as hydroquinone are employed and the pH is in the acidic range. The concentration of bisulfite is between 0.1 and 6 M bisulfite, preferably between 1 M and 5.5 M, the concentration of the chaotropic agent is between 1 and 8 M, whereby preferably guanidinium salts are employed, the pH is in the acidic range, preferably between 4.5 and 6.5, the temperature is between 0 °C and 90 °C, preferably between room temperature (25 °C) and 90 °C, and the reaction time is between 30 min and 24 hours or 48 hours or even longer, but preferably between 1 hour and 24 hours. The desulfonation step is performed by adding an alkaline solution or buffer as e.g. a solution only containing a hydroxide, e.g. sodium hydroxide, or a solution containing ethanol, sodium chloride and sodium hydroxide (e.g. 38% EtOH, 100 mM NaCl, 200 mM NaOH) and incubating at room temperature or elevated temperatures for several min, preferably between 5 min and 60 min.

The method according to the invention allows a relatively short reaction time of the bisulfite reaction giving the possibility to perform a DNA assay within one working day. One parameter to speed the reaction is the temperature. To decrease the DNA degradation process, a low pH value is of advantage. By the use of a 5 M bisulfite

- 6 -

solution of a pH value of 5.5 at a temperature of approximately 80°C, a reaction time of e.g. between 120 and 180 min is possible. Further, the reaction under conditions according to the invention is more specific for cytosine compared to 5-methylcytosine as with standard conditions after 16 h. Additives for stabilization of the bisulfite reagent like hydroquinone are possible.

Detailed description of the invention

The invention is related to a method for the conversion of a cytosine base, preferably cytosine bases in a nucleic acid to an uracil base, preferably uracil bases, whereby preferably a 5-methyl-cytosine base, preferably 5-methyl-cytosine bases, is not significantly converted, comprising the steps of

a) incubating a solution comprising the nucleic acid for a time period of 1.5 to 3.5 hours at a temperature between 70 and 90 °C, whereby the concentration of bisulfite in the solution is between 3 M and 6.25 M and whereby the pH value of the solution is between 5.0 and 6.0 whereby the nucleic acid is deaminated, and

b) incubating the solution comprising the deaminated nucleic acid under alkaline conditions whereby the deaminated nucleic acid is desulfonated.

In a preferred embodiment of the invention, the method may further comprise the step of desalting the solution comprising the deaminated and desulfonated nucleic acid. This can be achieved e.g. by ultrafiltration, gel filtration, precipitation as known to the expert skilled in the art or by binding to magnetic glass particles as described in WO 96/41811.

In a preferred embodiment of the invention, the temperature in the method according to the invention is between 75 and 85 °C. In another preferred embodiment of the invention, the concentration of bisulfite is between 3.2 M and 6 M, preferably between 4.75 M and 5.5 M. In another preferred embodiment of the invention, the pH value of the solution is between 5.25 and 5.75. In another preferred embodiment of the invention, the time period is between 1.75 and 3 hours. In another preferred embodiment of the invention, the time period is between 2 and 3 hours, preferably between 2 and 2.5 hours. The reaction is also

possible in a time period between 0.75 and 3.5 hours. In the most preferred embodiment of the invention, in step a) the temperature is 80 °C, the concentration of bisulfite is 5 M, the pH value of the solution is 5.5 and the time period is preferably between 2 and 2.5 or 3 hours, most preferred 2 hours.

- 5 The method is preferably performed in solution, however, it is also feasible that the method according to the invention is performed while the nucleic acid is in a solid phase bound form, i.e. it is bound to a solid phase under suitable conditions. The solid phase may be a silicon oxide, preferably in the form of glass fleeces or fibers or magnetic glass particles as described in WO96/41811, WO 00/32762 and WO
10 01/37291. The principal method of performing a bisulfite treatment while the nucleic acid is bound to a solid phase is e.g. described e.g. in the European patent application with the number EP 02 019 097.1 and EP 02 028 114.3.

- The expert skilled in the art knows how to perform the bisulfite reaction, e.g. by referring to Frommer et al., *supra*, Grigg and Clark, *supra* or Grunau et al., *supra*
15 who disclose the principal parameters of the bisulfite reaction.

- In an embodiment of the invention, the nucleic acid is deoxyribonucleic acid (DNA), in particular genomic DNA or nucleic acid, i.e. the DNA or nucleic acid which is found in the organism's genome and is passed on to offspring as information necessary for survival. The phrase is used to distinguish between other
20 types of DNA, such as found within plasmids. The source of the nucleic acid may be eukaryotic or prokaryotic, preferably from vertebrates, particularly from mammals, most preferred from animals or humans.

- In an embodiment of the invention the nucleic acid is obtained from a biological sample using the solid phases as described above and methods known to the expert
25 in the field. The biological sample comprises cells from multicellular organisms as e.g. human and animal cells such as leucocytes, and immunologically active low and high molecular chemical compounds such as haptens, antigens, antibodies and nucleic acids, blood plasma, cerebral fluid, sputum, stool, biopsy specimens, bone marrow, oral rinses, blood serum, tissues, urine or mixtures thereof. In a preferred
30 embodiment of the invention the biological sample is a fluid from the human or animal body. The biological sample can be blood, blood plasma, blood serum, tissue or urine. The biological sample comprising the nucleic acids is lysed to create

- 8 -

a mixture of biological compounds comprising nucleic acids and other components. Procedures for lysing biological samples are known by the expert and can be chemical, enzymatic or physical in nature. A combination of these procedures is applicable as well. For instance, lysis can be performed using
5 ultrasound, high pressure, shear forces, alkali, detergents or chaotropic saline solutions, or proteases or lipases. For the lysis procedure to obtain nucleic acids, special reference is made to Sambrook, J., et al., in "Molecular Cloning: A Laboratory Manual" (1989), eds. J. Sambrook, E. F. Fritsch and T. Maniatis, Cold Spring Harbour Laboratory Press, Cold Spring Harbour, NY; and Ausubel, F., et al.,
10 in "Current protocols in molecular biology" (1994), eds. F. Ausubel, R. Brent and K. R.E., Wiley & Sons, New York. Then the nucleic acids are isolated from the lysis mixture using the methods known to the expert skilled in the art, e.g. using solid phases as magnetic glass particles (WO96/41811), and can then be subjected to the methods according to the invention, i.e. the bisulfite treatment according to the
15 invention. Chaotropic agents are also used to lyse cells to prepare a mixture between nucleic acids and other biological substances (see e.g. Sambrook et al. (1989) or EP 0 389 063). Afterwards a material comprising glass or silica may be added and a purification effect results from the behavior of DNA or RNA to bind to material with a glass surface under these conditions i.e. in the presence of certain
20 concentrations of a chaotropic agent, higher concentrations of organic solvents or under acidic conditions. Sequence specific capturing can also be used for this purpose.

In a preferred embodiment of the invention, the nucleic acid is amplified after the steps of the method according to the invention with the polymerase chain reaction
25 (PCR: EP 0 201 184; EP-A-0 200 362; US 4,683,202). The amplification method may also be the Ligase Chain Reaction (LCR: Wu, D. Y., and Wallace, R. B., Genomics 4 (1989) 560-569; and Barany, F., Proc. Natl. Acad. Sci. USA 88 (1991) 189-193), Polymerase Ligase Chain Reaction (Barany, F., PCR Methods Appl. 1 (1991) 5-16), Gap-LCR (PCT Patent Publication No. WO 90/01069), Repair Chain
30 Reaction (European Patent Publication No. EP-A 0 439 182), 3SR (Kwoh, D. Y., et al., Proc. Natl. Acad. Sci. USA 86 (1989) 1173-1177; Guatelli, J. C., et al., Proc. Natl. Acad. Sci. USA 87 (1990) 1874-1878; PCT Patent Publication No. WO 92/0880A), and NASBA (U.S. Pat. No. US 5,130,238). Further, there are strand displacement amplification (SDA), transcription mediated amplification (TMA), and Q β -
35 amplification (for a review see e.g. Whelen, A.C., and Persing, D.H., Annu. Rev.

Microbiol. 50 (1996) 349-373; Abramson, R. D., and Myers, T.W., Curr. Opin. Biotechnol. 4 (1993) 41-47). Particularly preferred amplification methods according to the invention are the methylation specific PCR method (MSP) disclosed in US 5,786,146 which combines bisulfite treatment and allele-specific
5 PCR (see e.g. US 5,137,806, US 5,595,890, US 5,639,611).

In a preferred embodiment, the method may further comprise the step of detecting the amplified nucleic acid. The amplified nucleic acid may be determined or detected by standard analytical methods known to the person skilled in the art and described e.g. by Sambrook, J., et al., in "Molecular Cloning: A Laboratory Manual"
10 (1989), eds. J. Sambrook, E. F. Fritsch and T. Maniatis, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY; Lottspeich and Zorbas, in "Bioanalytik" (1998), eds. L. a. Zorbas, Spektrum Akademischer Verlag, Heidelberg, Berlin, Germany; or by Ausubel, F., et al., in "Current protocols in molecular biology" (1994), eds. F. Ausubel, R. Brent and K. R.E., Wiley & Sons Verlag, New York.
15 There may be also further purification steps before the target nucleic acid is detected e.g. a precipitation step. The detection methods may include but are not limited to the binding or intercalating of specific dyes as ethidium bromide which intercalates into the double-stranded DNA and changes its fluorescence thereafter. The purified nucleic acids may also be separated by electrophoretic methods
20 optionally after a restriction digest and visualized thereafter. There are also probe-based assays which exploit the oligonucleotide hybridisation to specific sequences and subsequent detection of the hybrid. It is also possible to sequence the target nucleic acid after further steps known to the expert in the field. Other methods apply a diversity of nucleic acid sequences to a silicon chip to which specific probes
25 are bound and yield a signal when a complementary sequence binds.

In a particularly preferred embodiment of the invention, the nucleic acid is detected by measuring the intensity of fluorescence light during amplification. This method entails the monitoring of real time fluorescence. A particularly preferred method exploiting simultaneous amplification and detection by measuring the intensity of
30 fluorescent light is the TaqMan® method disclosed in WO 92/02638 and the corresponding US patents US 5,210,015, US 5,804,375, US 5,487,972. This method exploits the exonuclease activity of a polymerase to generate a signal. In detail, the nucleic acid is detected by a process comprising contacting the sample with an oligonucleotide containing a sequence complementary to a region of the target

- 10 -

nucleic acid and a labeled oligonucleotide containing a sequence complementary to a second region of the same target nucleic acid strand, but not including the nucleic acid sequence defined by the first oligonucleotide, to create a mixture of duplexes during hybridization conditions, wherein the duplexes comprise the target nucleic acid annealed to the first oligonucleotide and to the labeled oligonucleotide such that the 3'-end of the first oligonucleotide is adjacent to the 5'-end of the labeled oligonucleotide. Then this mixture is treated with a template-dependent nucleic acid polymerase having a 5' to 3' nuclease activity under conditions sufficient to permit the 5' to 3' nuclease activity of the polymerase to cleave the annealed, labeled oligonucleotide and release labeled fragments. The signal generated by the hydrolysis of the labeled oligonucleotide is detected and/ or measured. TaqMan® technology eliminates the need for a solid phase bound reaction complex to be formed and made detectable. In more general terms, the amplification and/ or detection reaction of the method according to the invention is a homogeneous solution-phase assay. Further preferred methods are the formats used in the LightCycler® instrument (see e.g. US 6,174,670). Particularly preferred is the use of bisulfite treatment, amplification with or without methylation specific primers in the presence of a methylation-specific probe and real-time fluorescence detection as described in US 6,331,393.

In a preferred embodiment of the present invention, the method is automated, i.e. the method carries out an automatable process as e.g. described in WO 99/16781. Automatable process means that the steps of the process are suitable to be carried out with an apparatus or machine capable of operating with little or no external control or influence by a human being. Automated method means that the steps of the automatable method are carried out with an apparatus or machine capable of operating with little or no external control or influence by a human being. Only the preparation steps for the method may have to be done by hand, e.g. the storage containers have to be filled up and put into place, the choice of the samples has to be done by a human being and further steps known to the expert in the field, e.g. the operation of the controlling computer. The apparatus or machine may e.g. add automatically liquids, mix the samples or carry out incubation steps at specific temperatures. Typically, such a machine or apparatus is a robot controlled by a computer which carries out a program in which the single steps and commands are specified. In a preferred embodiment of the invention, the method is in a high-throughput format, i.e. the automated methods is carried out in a high-throughput

format which means that the methods and the used machine or apparatus are optimized for a high-throughput of samples in a short time.

Preferably, the method according to the invention is used in diagnostics, for diagnostic analysis or for bioanalytics, or for the screening of tissue or fluids from the human or even animal body for the presence of a certain methylation pattern. Further, the method according to the invention is used to enhance the speed, accuracy or sensitivity of the detection of methylation sites in nucleic acids.

In another embodiment of the invention, a solution with a pH value between 5.0 and 6.0 and comprising bisulfite in a concentration between 3 M and 6.25 M is used in a reaction at a reaction temperature between 70 and 90 °C wherein a cytosine base, preferably cytosine bases, in a nucleic acid are converted to an uracil base, preferably uracil bases, in the presence of bisulfite ions whereby preferably a 5-methyl-cytosine base, preferably 5-methyl-cytosine bases, is not significantly converted. Preferably, the pH value of the solution is between 5.25 and 5.75 and the concentration of bisulfite is between 3.2 M and 6 M, preferably between 4.75 M and 5.5 M. In the most preferred embodiment, the pH value of the solution is 5.5 and the concentration of bisulfite is 5 M. The solution may also contain hydroquinone for stabilisation. The solution according to the invention is preferably an aqueous solution. Preferably, the reaction temperature is between 75 and 85 °C.

In another embodiment of the invention a kit comprising a solution according to the invention. Preferably, The solution has a pH value between 5.25 and 5.75, more preferably between 5.4 and 5.6, and comprises bisulfite in a concentration between 3 M and 6.25 M. Preferably, the concentration of bisulfite is between 3.5 M and 6 M, preferably between 4.75 M and 5.5 M. The solution may optionally contain hydroquinone. In the most preferred embodiment, the pH value of the solution is 5.5 and the concentration of bisulfite is 5 M. Such kits known in the art further comprise plastics ware which may be used during the bisulfite procedure as e.g. microtiter-plates in the 96 or 384 well format or reaction tubes manufactured e.g. by Eppendorf, Hamburg, Germany. The kit may further comprise a washing solution which is suitable for the washing step of the solid phase, in particular, the glass fleece or membrane or the magnetic glass particles. Often the washing solution is provided as a stock solution which has to be diluted before the use. The kit may further comprise an eluent, i.e. a solution or a buffer (e.g. TE, 10 mM Tris, 1 mM

- 12 -

EDTA, pH 8.0) or pure water to elute the DNA or RNA bound to the solid phase. Further, additional reagents may be present which contain buffers suitable for use in the present invention. Preferably, the kit according to the invention is used for a reaction wherein a cytosine base, preferably cytosine bases, in a nucleic acid are
5 converted to an uracil base, preferably uracil bases, in the presence of bisulfite ions whereby preferably a 5-methyl-cytosine base, preferably 5-methyl-cytosine bases, are not significantly converted.

In another embodiment of the invention, a solution is provided with a pH value between 5.4 and 5.6 and comprising bisulfite in a concentration between 3.5 M and
10 6.25 M. The solution optionally contains hydroquinone or other radical scavengers. Preferably, the concentration of bisulfite is between 3.75 M and 6 M, preferably between 4.75 M and 5.5 M. In the most preferred embodiment, the pH value of the solution is 5.5 and the concentration of bisulfite is 5 M.

The following examples, references, sequence listing and figures are provided to aid
15 the understanding of the present invention, the true scope of which is set forth in the appended claims. It is understood that modifications can be made in the procedures set forth without departing from the spirit of the invention.

1 Examples

1.1 Comparison optimized conditions with standard conditions using a model system (oligonucleotide) and analysis by HPLC

1.1.1 Method:

5 1.1.1.1

Composition of reagents

Bisulfite reagent pH = 5,0/50°C: 1,9g Na₂S₂O₅
("Standard") 2ml Millipore water
0,7ml 2M NaOH
0,5ml 1M hydroquinone (optional)
10 addition of Millipore water to a volume of 4
ml

Bisulfite reagent pH = 5,5/80°C: 1,9g Na₂S₂O₅
1ml Millipore water
15 2ml 2M NaOH
0,5ml 1M hydroquinone (optional)
addition of Millipore water to a volume of 4
ml

Hydroquinone can be added optionally; it is not necessary if the reagent is prepared
20 freshly for the experiment.

Sequences:

The oligonucleotides are synthesized using standard automated solid-phase synthesis procedure applying phosphoramidite chemistry.

GSTP1 sequence:

25 SEQ ID NO: 1: 5'-d(GAGGGGCGCCCTGGAGTCCC)-3' (sense strand)
SEQ ID NO: 2: 5'-d(GGGACTCCAGGGCGCCCTC)-3' (antisense strand)
SEQ ID NO: 3: 5'-d(GAGGGGUGUUUTGGAGTUUU)-3' (sense strand C converted
to U (product))
SEQ ID NO: 4: 5'-d(GGGAUTUUAGGGUGUUUUTU)-3' (antisense strand C
30 converted to U (product))

- 14 -

C or C^{Me} in the center position of T₁₀:

SEQ ID NO: 5: 5'-d(T₅CT₅)-3'

SEQ ID NO: 6: 5'-d(T₅C^{Me}T₅)-3'

SEQ ID NO: 7: 5'-d(T₅UT₅)-3'

5 SEQ ID NO: 8: 5'-d(T₁₁)-3'

1.1.1.2

Reaction conditions:

Ca. 5 nmole of a single stranded oligonucleotide or 5 nmole of each strand of a double stranded oligonucleotide are dissolved in 20µl of Millipore water, then 200µl
10 of the bisulfite reagent are added. Thereafter the reaction tube is placed into a thermomixer (50°C or 80°C; 600rpm). After t = x hours the reaction is stopped by addition of 500µl of 2,5M NaOH (desulfonation). After 30min at r.t. the reaction mixture is desalted over a Sephadex G25 column. The oligonucleotide containing fraction is evaporated and dissolved in 200µl of Millipore water to be analyzed by
15 HPLC.

1.1.1.3

Evaluation

20	Analytical HPLC:	column:	Dionex DNA Pac PA-100 SEL
		buffer A:	0,01M NaOH, 0,2 M NaCl
		buffer B:	0,01M NaOH, 1M NaCl
		gradient:	50-100% B in 25min

Data evaluation: HPLC chromatograms are compared by HPLC-area% of the product peak at t = x and are shown in Figs. 2 to 12

1.1.2 Results

1.1.2.1

Reaction kinetics GSTP1 ds at T = 80°C, pH = 5,5

25 A double determination was performed according to the standard protocol described above with the GSTP1 sequences SEQ ID NO:1 which is the sense strand and SEQ ID NO:2 which is the antisense strand, the mean average values are calculated.

- 15 -

t [min]	HPLC area% product	Figure
10	0	2
30	27,0	3
60	77,5	4
90	87,5	5
120	89,9	6
150	90,4	7
180	88,6	8

1.1.2.2

2	89,5	2,46	0,0275
3	90,2	2,24	0,0248
4	89,7	2,88	0,0322
Mean value	89,8	2,56	0,0285

5

1.1.3 Conclusions

Conditions according to the invention lead to a similar product yield after 2 h reaction time as standard conditions after 8-16 h. Specificity of bisulfite reaction is significantly better for conditions according to the invention after 2 h compared to "standard conditions" after 16 h.

10

1.2 Comparison of certain conditions of the bisulfite method using PCR of bisulfite treated genomic DNA

1.2.1 General

The fact that the bisulfite reaction has worked and converted non-methylated
5 cytosines to uracil can also be demonstrated by a polymerase chain reaction
whereby primers are used which are specific to a region of the nucleic acid sequence
wherein non-methylated cytosines have been converted to uracils, i.e. the base
adenine in the primer is opposite to the uracil being the bisulfite reaction product
10 not hybridize to this region as there would be cytosines not matching the adenine
bases in the primer. This would have the effect that no PCR product would be
obtained.

An improved method to perform rapid polymerase chain reactions is disclosed e.g.
in US 6,174,670 and is used in the LightCycler® instrument (Roche, Mannheim,
15 Germany). In this method, two labeled probes can come into close proximity in an
amplificate dependent manner so that the two labels can perform a fluorescence
energy transfer (FRET). The amount of the amplificate thereby correlates with the
intensity of the emitted light of a certain wavelength. This specific PCR method can
therefore be used to analyze whether a complete conversion of non-methylated
20 cytosines was obtained, by e.g. analyzing the promoter region of the glutathion-S-
transferase π gene (see e.g. US 5,552,277, Genbank accession code M24485 and
Morrow et al. (1989) Gene 75, 3-11) using suitable probes and primers. However,
the expert skilled in the art knows that other methods can be used for this
evaluation as well. Fluorescence measurements are normalized by dividing by an
25 initial fluorescence measurement, i.e., the background fluorescence, obtained
during a cycle early in the reaction while the fluorescence measurements between
cycles appear to be relatively constant. The cycle number chosen for the initial
fluorescence measurement is the same for all reactions compared, so that all
measurements represent increases relative to the same reaction cycle. In the early
30 cycles of a polymerase chain reaction amplification, the number of target molecules
can be described by the geometric equation $N_i = N_0 \times (1 + E)^i$, where N_0 = the
number of target molecules at the start of the reaction, N_i = the number of target
molecules at the completion of the i-th cycle, E = the efficiency of the amplification

($0 \leq E \leq 1$). During this geometric growth phase of the amplification, the number of cycles required to reach a particular threshold value (C_T value or crossing point) is inversely proportional to the logarithm of $(1 + E)$. Thus, the C_T value represents a measure of the reaction efficiency that allows comparisons between reactions. A decrease in the C_T value, which means that the reaction reached the threshold value in fewer cycles, indicates an increase in reaction efficiency. As the increase in amplification product is monitored by measuring the increase in reaction fluorescence, the C_T is defined herein as the number of amplification cycles carried out until the fluorescence exceeded an arbitrary fluorescence level (AFL). The AFL was chosen close to the baseline fluorescence level, but above the range of random fluctuations in the measured fluorescence, so that the reaction kinetics were measured during the geometric growth phase of the amplification. Accumulation of amplified product in later cycles inhibits the reaction and eventually leads to a reaction plateau. An AFL of 1.5 was chosen for all reactions. Because a PCR amplification consists of discrete cycles and the fluorescence measurements are carried out once per cycle, the measured fluorescence typically increases from below the AFL to above the AFL in a single cycle. To improve the precision of the measurements, an "exact" number of cycles to reach the AFL threshold, referred to herein as the C_T value or crossing point, was calculated by interpolating fluorescence measurements between cycles.

1.2.2 Methods

1.2.2.1 *Denaturation of DNA*

100 μ l of methylated DNA (Intergen, distributed by Serologicals Corporation, Norcross, GA, USA; Cat S 7821) dilution (100ng/ assay spiked in 1000ng human DNA background, Roche Cat.1691112; 4 replicates per method), and 12 μ l 2 M NaOH are mixed and incubated for 15 min at 37 °C.

1.2.2.2 *Deamination of DNA*

112 μ l of the denatured DNA are mixed with 200 μ l bisulfite reagent (2.5M sodium disulfite, 125 mM hydroquinone, pH 5.1) and incubated for 20 h at 50 °C ("Standard method")

or

112 µl of the denatured DNA are mixed with 200 µl bisulfite reagent (2.5M sodium disulfite, 125 mM hydroquinone, pH 5.5) and incubated for 2h at 80°C ("BIS-METHOD").

1.2.2.3

Processing using magnetic glass particles (MGPs)

5 312 µl of the deaminated DNA (from both methods respectively) are mixed with 600 µl binding buffer (MagNAPure DNA Isolation Kit I, Roche Cat. Nr. 3 003 990) and 75µl magnetic glass particle solution (MagNAPure DNA Isolation Kit I) and incubated for 15min/ room temperature with continuous mixing in order to bind the nucleic acid to the MGPs according to the method described in the European
10 patent applications with the numbers EP02019097.1 or EP02028114.3. Thereafter, the magnetic glass particles (MGPs) are washed three times with 1 ml 70% ethanol. Bound free separation is done in a magnetic separator (Roche Cat.1641794). Thereafter, desulfonation takes place by adding 250 µl 38% EtOH / 100mM NaCl / 200mM NaOH to the DNA bound to the MGPs; the mixture is incubated for 5min
15 at room temperature with mixing. Thereafter the MGPs are washed two times with 90% Ethanol. To get rid of ethanol rests the MGPs were heated for 15min./60°C in a thermomixer with open lid. Thereafter the DNA is eluted with 50µl 10mM Tris/0.1mM EDTA pH 7.5 (15min./60°C). 10µl of the eluted DNA is used for subsequent PCR analysis.

20 1.2.2.4

Detection of the bisulfite treated DNA by using a specific PCR on the LightCycler® instrument (hyprobe-format)

1.2.2.4.1

Composition of Mastermix

LightCycler® FastStart DNA Master HybridizationProbe 1x (Roche 2239272), 2mM MgCl₂, forward Primer 0.5 µM, reversed Primer 0.5 µM, donor probe 250
25 nM, acceptor probe 250 nM, template 10 µl, total PCR volume 20 µl.

1.2.2.4.2

PCR-conditions

Denaturation 10min/95°C

55 cycles 95°C/10s

65°C/10s – signal acquisition

30 72°C/10s Ramp time 20°C/s

Samples were run in parallel in the same run on the LightCycler® instrument.

1.2.2.5

Results:

Sample-Nr.*	BIS-Method	Ct-value	Median Ct-value
1	„standard“	30.08	
2	„standard“	30.07	
3	„standard“	30.13	
4	„standard“	30.13	30.10
5	“BIS Method”	29.11	
6	“BIS Method”	30.14	
7	“BIS Method”	30.14	
8	“BIS Method”	29.58	29.74

The crossing points show that the “BIS Method” according to the invention is
5 slightly more sensitive as the „standard“ method.

1.2.3 Example: Variation of temperature and time of the bisulfite method
according to the invention

The following experiments were performed using the experimental setup of the
example under 1.2.1 whereby the temperature and the incubation time were varied
10 and the indicated ct-values measured.

Sample	Incubation time [min]	Ct-value	Temperature	Median Ct- value
1	180	28.56	80 °C	28.35
2	180	28.15	80 °C	
3	180	28.03	80 °C	
4	180	28.64	80 °C	
5	150	28.86	80 °C	28.57
6	150	28.64	80 °C	
7	150	28.08	80 °C	
8	150	28.71	80 °C	
9	120	28.94	80 °C	28.94
10	120	29.02	80 °C	
11	120	28.77	80 °C	
12	120	29.04	80 °C	
13	90	29.76	80 °C	29.67
14	90	29.76	80 °C	
15	90	29.60	80 °C	
16	90	29.57	80 °C	
17	60	30.02	95 °C	30.86
18	60	29.86	95 °C	
19	60	33.54	95 °C	
20	60	30.01	95 °C	

This experiment shows that the extension of incubation time to 3 hours is not critical, whereas shortening of the incubation time to 90min. results in a small loss of sensitivity. A higher loss of sensitivity resulted when the incubation time was shortened to 60 min but incubation temperature was elevated to 95°C.

Patent Claims

1. Method for the conversion of a cytosine base in a nucleic acid to an uracil base comprising the steps of
 - 5 a) incubating a solution comprising the nucleic acid for a time period of 1.5 to 3.5 hours at a temperature between 70 and 90 °C, whereby the concentration of bisulfite in the solution is between 3 M and 6.25 M and whereby the pH value of the solution is between 5.0 and 6.0 whereby the nucleic acid is deaminated, and
 - 10 b) incubating the solution comprising the deaminated nucleic acid under alkaline conditions whereby the deaminated nucleic acid is desulfonated.
2. Method according to claim 1,
15 characterized in that
in step a) the temperature is between 75 and 85 °C.
3. Method according to any of the claims 1 to 2,
characterized in that
20 the concentration of bisulfite is between 3.2 M and 6 M.
4. Method according to any of the claims 1 to 3,
characterized in that
the pH value of the solution is between 5.25 and 5.75.
25
5. Method according to any of the claims 1 to 4,
characterized in that
the time period is between 1.75 and 3 hours.
- 30 6. Method according to any of the claims 1 to 5,
characterized in that
the time period is between 2 and 3 hours.

- 25 -

7. Method according to any of the claims 1 to 6,
characterized in that
in step a) the temperature is 80 °C, the concentration of bisulfite is 5 M, the
pH value of the solution is 5.5 and the time period is between 2 and 3 hours.
- 5 8. Use of a solution with a pH value between 5.0 and 6.0 comprising bisulfite in
a concentration between 3 M and 6.25 M at a reaction temperature between
70 and 90 °C and optionally comprising hydroquinone in a reaction wherein
a cytosine base in a nucleic acid is converted to an uracil base in the presence
10 of bisulfite ions...
9. Use according to claim 8 wherein the pH value of the solution is between 5.25
and 5.75 and wherein the concentration of bisulfite is between 3.2 M and 6
M.
- 15 10. Use according to any of the claims 8 to 9 wherein the pH value of the solution
is 5.5 and wherein the concentration of bisulfite is 5 M.
11. Kit comprising a solution with a pH value between 5.0 and 6.0 comprising
20 bisulfite in a concentration between 3 M and 6.25 M and optionally
comprising hydroquinone.
12. Solution with a pH value between 5.4 and 5.6 and comprising bisulfite in a
concentration between 3.5 M and 6.25 M and optionally comprising
25 hydroquinone.
13. Solution according to claim 12 wherein the concentration of bisulfite is
between 3.75 M and 6 M.
- 30 14. Solution according to any of the claims 12 to 13 wherein the pH value of the
solution is 5.5 and wherein the concentration of bisulfite is 5 M.

INTERNATIONAL SEARCH REPORT

International Application No
PCT/EP2004/000729

A. CLASSIFICATION OF SUBJECT MATTER IPC 7 C07H21/04 C01D5/00 C12Q1/68		
According to International Patent Classification (IPC) or to both national classification and IPC		
B. FIELDS SEARCHED Minimum documentation searched (classification system followed by classification symbols) IPC 7 C07H C01D C12Q		
Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched		
Electronic data base consulted during the International search (name of data base and, where practical, search terms used) EPO-Internal, CHEM ABS Data		
C. DOCUMENTS CONSIDERED TO BE RELEVANT		
Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	GRUNAU C., CLARK S.J., ROSENTHAL A.: "Bisulfite genomic sequencing: systematic investigation of critical experimental parameters" NUCLEIC ACIDS RESEARCH, vol. 29, no. 13, 2001, pages e65-1-e65-7, XP002241346 Oxford	8,11
Y	cited in the application page e65-2, left-hand column "deamination"; page e65-3, table 1, entry 5 and 6 --- -/--	1-7,9, 10,12-14
<input checked="" type="checkbox"/> Further documents are listed in the continuation of box C. <input checked="" type="checkbox"/> Patent family members are listed in annex.		
* Special categories of cited documents : "A" document defining the general state of the art which is not considered to be of particular relevance "E" earlier document but published on or after the International filing date "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified) "O" document referring to an oral disclosure, use, exhibition or other means "P" document published prior to the International filing date but later than the priority date claimed "T" later document published after the International filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art "Z" document member of the same patent family		
Date of the actual completion of the International search 13 May 2004		Date of mailing of the International search report 07/06/2004
